This device can monitor and detect the following according to the below picture:

1. **SF6**:  
   For measuring of SF6 gas density, a special sensor is used. This sensor also can measure the temperature of the gas and monitors the SF6 leak rate and calculates the last date to refill.

2. **Mechanical operation**:  
   close and open operating times, primary contacts separation speed, damping and over travel of contact, detects deterioration in mechanical performance (friction, corrosion, breakage, spring fatigue, weariness of linking and rods, and damping defects)

3. **Recharging motor operating time**:  
   motor supply voltage, current and energy, motor or limit switch defects, spring travel.

4. **Hydraulic operating mechanism**:  
   pump motor operating time, internal and external leakage, threshold pressure on hydraulic system

5. **Switching**:  
   current during breaking, primary contact wear, arc time.

6. **Auxiliary and control circuits**:  
   operating coil continuity, coil current, voltage, resistance, armature time and energy, auxiliary supply voltage, heater integrity.
